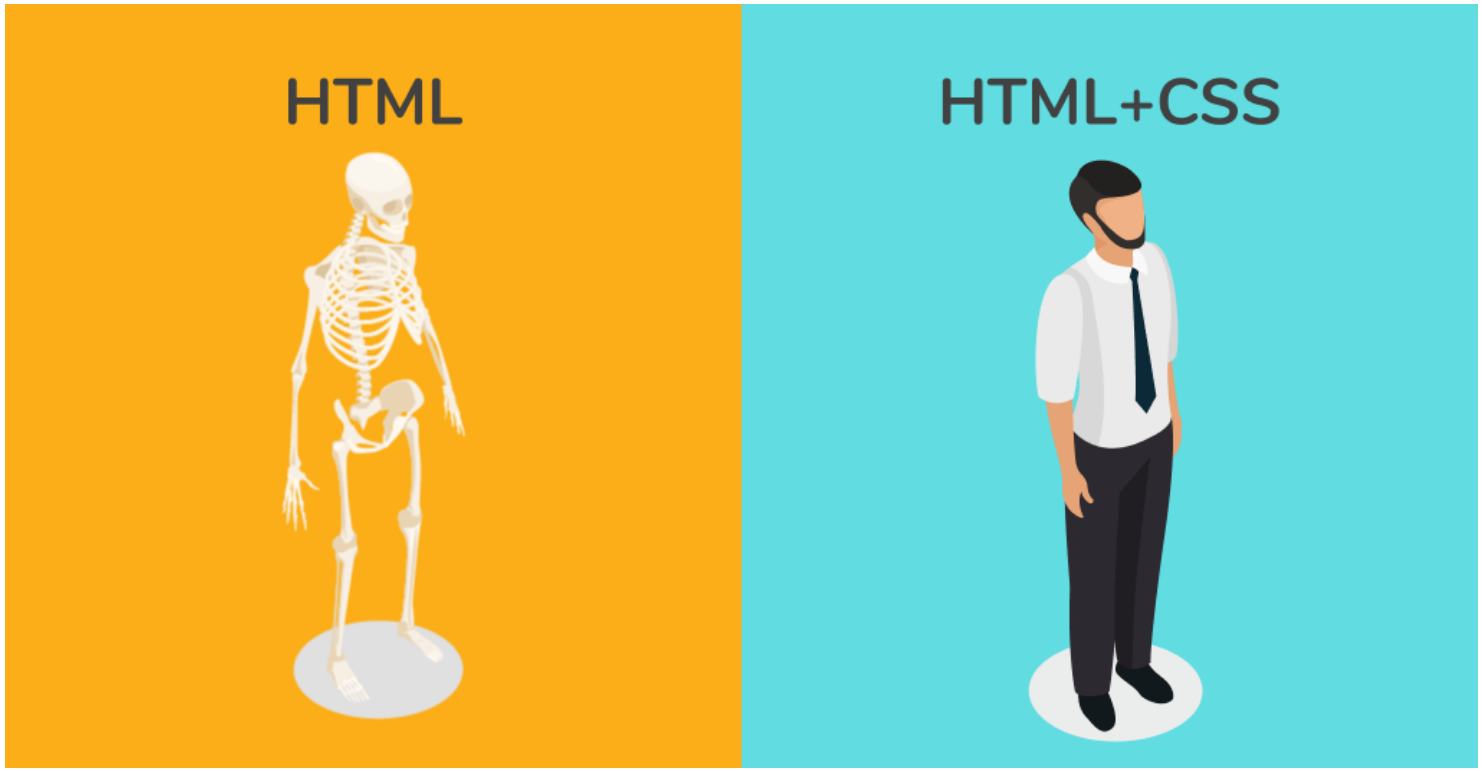
Websites

HTML & CSS



Introduction to Websites

A website is a collection of web pages connected together and accessible through the Internet.
Each page is created using code — mainly **HTML** and **CSS**.
Think of it like:
🏠 A website = a house
📄 Each page = a room
💻 The Internet = the city where all houses are connected

Every website needs:
•A **Domain Name** (e.g., www.google.com)
•A **Web Server** (stores the site)
•Files written in **HTML, CSS, and JavaScript**

What is HTML? (The Skeleton)

HTML → HyperText Markup Language

It defines the **structure** and **content** of a webpage.
It tells the browser what to display.

HTML = Skeleton of a Website

- Gives structure (headings, paragraphs, images, links, etc.)
- Uses tags like <h1>, <p>, <img>, <a>

Example:

```
<html>
        <body>
                <h1>Welcome to My Website</h1>
                <h3>My name is Ahmed</h3>
                <img src="photo.jpg" >
        </body>
</html>
```

Result:

•Displays a title

•Adds a short paragraph

•Shows an image

🟩 **Tip:** HTML is not a programming language — it's a **markup language**.

What is CSS? (The Style)

CSS → Cascading Style Sheets

It controls the **look and design** of a website.

CSS = Skin, Muscles, and Clothes of the Body

•Adds colors

•Changes fonts Sets layouts and spacing

•Controls animations

Example:

```
<html>
        <style>
                body{background-color:powderblue}
                h1{color:red; font-size:64px}
                h3{color:green; font-size:32px;}
        </style>
         <body>
                 <h1>Welcome to My Website</h1>
                 <h3>My name is Ahmed</h3>
                 <img src="photo.jpg jpg " >
        </body>
</html>
```

- CSS can be written **inside** the HTML file or in a **separate file** (style.css).

HTML + CSS Together

How they work together:

•HTML provides **content**

•CSS provides **style**

💡 **Analogy:**

HTML is the *structure* of a house.

CSS is the *paint, furniture, and decoration.*

HTML Elements & Tags

Common HTML Elements:

Tag	Meaning	Example
<h1>	Heading	<h1>Title</h1>
	Paragraph	Text here
<img>	Image	<img src="file.jpg">
<a>	Link	<a href="https://...">Click Here</a>

Tag Structure:
<tagname> content
</tagname>

CSS Syntax

CSS uses a simple rule structure:
Syntax:

```
selector {
  property: value;
}
```

Example:

```
h1 {
  color: blue;
  font-size: 30px;
}
```

Explanation:

- *Selector:* h1 → which element to style
- *Property:* color, font-size
- *Value:* blue, 30px

Database and Web Connection (Intro)

While HTML & CSS handle **content and design**, most modern websites also use **databases** to store data.

Examples:

- Instagram → stores photos & likes in databases
- Online shop → stores products, prices, users

Common Databases:

- MySQL
- MongoDB
- PostgreSQL

Languages used:

HTML (front-end) + CSS (design) + SQL/Python/JavaScript (back-end)

Summary

Part	Purpose	Example
HTML	Structure	Headings, paragraphs, links
CSS	Design	Colors, fonts, layout
Database	Data	Stores and retrieves user info

Together they create **modern, dynamic, and beautiful websites.**

Quiz

1- HTML stands for:
a) Hyperlink Text Making Language
b) HyperText Markup Language
c) High Transfer Machine Language

2- CSS is mainly used for:
a) Website logic
b) Styling and design
c) Data storage

3- <img> tag is used to:
a) Create a link
b) Add an image
c) Insert a video

4- True or False:
CSS controls how a website looks.
